

Metabolyst C.A.R.E. Solution for Pharmacy

Pharmacy Pre-Processing, Identification, and Workflow Management

A typical hospital pharmacy processes hundreds of faxes, containing possibly thousands of medication orders each day. Every piece of paper represents a potential error or delay in the medication order process due to lost or misplaced faxes, duplicate orders, equipment malfunctions, and the like.

With our pharmacy application, the nurse or physician merely faxes or scans the order, which is then digitized and routed by our workflow engine to the proper pharmacy queue for processing, in accordance with your defined parameters and processes.

Example of Pharmacy workflow:

Missing or incorrect information can be immediately flagged for resolution using our **Multi-Check Patient Validation**, reducing potential errors and delays.

- Read Barcode for MR Number or Patient Name
- Look Up HL7/ADT for Patient Name or MR Number
- OCR Patient Name or MR Number
- Compare HL7/ADT Lookup with OCR results
- Depending upon OCR, Barcode and ADT lookup results, flag mis-matched orders

This added level of validation gives your reviewing Pharmacy Staff a visual notification if the system detects a possible mismatch.

Care givers can also quickly check on the status of their orders from any personal computer, virtually eliminating calls to the pharmacy. *Learn more by visiting us at www.Metabolyst.com.*

Key Benefits:

- Reduce number of Nursing calls to Pharmacy
- Enable load leveling for quicker processing of med orders
- Enable custom rules to auto sort and prioritize med order types
- Speed up end-to-end med order processing times
- Added level of patient safety using our **Multi-Check Patient Validation**
